Chapter 1

address for page pointer array

struct [bd_resc_page](#) - tracks DMA'able memory allocated for BD tables

list head to link elements : maximum pointers that can be stored in this page : number of pointer valid in this page

structure to track DMA'able memory allocated for command BD tables

Chapter 2

to access

`e1000_get_phy_addr_for_bm_page` - Retrieve PHY page address

Returns the phy address for the page requested.

`e1000_get_phy_addr_for_hv_page` - Get PHY address based on page

Chapter 3

Todo List

Class `ControlMessage` Remove this.

Member `FileWriter::FileWriter(const int id, const int write_block_size, const int write_blocks, const std::string &capt`
Obsolete parameter.

Class `IPEndpoint` Is this really required?

Namespace `log4cxx` Remove LOG4CXX and replace with more robust solution (perhaps syslog?).
Encapsulate LOG4CXX as a singleton.
Implement my own LOG4CXX?

Member `NetReader::NetReader(const int id, const std::string interface, const int snaplen, const int payload_length, c`
Robustify this.

Class `StatsWriter` Track this down and fix.

Inheritance diagram for FileWriter:

Public Member Functions

- [FileWriter](#) (const int id, const int write_block_size, const int write_blocks, const std::string &capture_file, const int poll_timeout, [StatsWriter](#) *const sw, const double command_interval)
- virtual [~FileWriter](#) ()
Destructor.
- virtual void [start](#) ()
Start the main processing loop [run\(\)](#) in its own thread of execution.
- virtual void [join](#) ()
Wait for the main processing loop/thread to exit.
- virtual void [cmd_stop](#) ()
- void [cmd_write_to_disk](#) ()
- int [open](#) ()
Custom API. Open capture file on disk.
- int [close](#) ()
Custom API. Close capture file on disk.
- bool [write](#) (boost::uint8_t *buf)
- bool [write_unbuffered](#) (boost::uint8_t *buf, const boost::uint32_t len)
- boost::uint8_t * [malloc_buffer](#) ()
- bool [free_buffer](#) (boost::uint8_t *buf)

Protected Types

- enum { [IDLE](#), [WRITE_TO_DISK](#), [STOP](#) }
The state of the object.

Protected Member Functions

- virtual void [run](#) ()
Main processing loop.
- virtual void [handle_stop](#) ()

- virtual void [handle_idle](#) ()
Command handler. Handles the IDLE state.
- virtual void [handle_write_to_disk](#) ()
- void [write_block](#) ()

Protected Attributes

- const int [_WRITE_BLOCK_SIZE](#)
The size of blocks to be written to disc.
- const int [_WRITE_BLOCKS](#)
The maximum number of write blocks that can be buffered at any one time.
- const int [_POLL_TIMEOUT](#)
The timeout for blocking operations.
- struct pollfd [_pfd](#)
Encapsulates the file descriptor of the file this object manages.
- std::list< boost::uint8_t * > [_write_bufs](#)
- std::list< boost::uint8_t * > [_free_bufs](#)
- enum FileWriter:: { ... } [_state](#)
- boost::mutex [_write_bufs_mutex](#)
Mutex that protects the write buffer from multi-threaded access.
- boost::mutex [_free_bufs_mutex](#)
Mutex that protects free list from multi-threaded access.
- boost::condition_variable [_read_cond](#)
- boost::condition_variable [_write_cond](#)
- const std::string [_capture_file](#)
The name of the file data will be written to.
- [StatsWriter](#) *const [_sw](#)

9.366.1 Detailed Description

Manages the high speed writing of data to file. Includes a circular buffer for storing buffers to be written, as well as a state machine that controls the operation of the thread. The class is an "active" object that runs in its own thread of execution. External objects can interact with it via the [start\(\)](#), [join\(\)](#), [cmd_XXX\(\)](#), [write\(\)](#), [open\(\)](#), and [close\(\)](#) methods.

Definition at line 56 of file `file_writer.h`.

9.366.2 Constructor & Destructor Documentation

- 9.366.2.1** `FileWriter::FileWriter (const int id, const int write_block_size, const int write_blocks, const std::string & capture_file, const int poll_timeout, StatsWriter *const sw, const double command_interval)`

Constructor

Parameters

<i>id</i>	A unique id for this object. Used for logging.
<i>write_block_size</i>	The size of the individual write blocks to be written to disk. WRITE_BLOCK bytes of data will be written to disk each time write_block() is called.
<i>write_blocks</i>	The total number of write blocks to buffer internally.
<i>poll_timeout</i>	todo 1.
<i>sw</i>	A pointer to a StatsWriter object. Performance data will be logged using this object.
<i>command_interval</i>	The main executin thread in run() will attempt to check for new commands every command_interval seconds. The actual interval between checks may be larger than this if the execution thread spends longer than command_interval processing individual tasks.

9.366.3 Member Function Documentation**9.366.3.1 void FileWriter::cmd_stop() [virtual]**

External API command. Insert a STOP command into the object's command queue for processing.

Implements [Threaded](#).

Definition at line 132 of file file_writer.cc.

```

{
    LOG4CXX_INFO(logger, "Received STOP");
    _state = STOP;
}

```

9.366.3.2 void FileWriter::cmd_write_to_disk ()

External API command. Insert a WRITE_TO_DISK command into the object's command queue for processing.

Definition at line 137 of file file_writer.cc.

```
    {  
        LOG4CXX_INFO(logger, "Received WRITE_TO_DISK");  
        _state = WRITE_TO_DISK;  
    }
```

9.366.3.3 void FileWriter::handle_stop () [protected, virtual]

Command handler. Handles the STOP command/state. On receiving this command, the [FileWriter](#) object will stop processing and exit the [run\(\)](#) method at the next opportunity.

Implements [Threaded](#).

Definition at line 142 of file file_writer.cc.

```
    {  
        _running = false;  
    }
```

9.366.3.4 void FileWriter::handle_write_to_disk () [protected, virtual]

Command handler. Handles the WRITE_TO_DISK command/state. On receiving this command, the [FileWriter](#) object will start reading data from its internal buffers and writing them to disk.

Definition at line 150 of file file_writer.cc.

```
    {  
        write_block();  
    }
```

9.366.3.5 bool FileWriter::write (boost::uint8_t * buf)

External API. Write buffer to disk. The supplied buffer is stored in the internal buffer queue where it waits to be written to disk by the main processing loop.

Parameters

<i>buf</i>	The buffer to be written to disk.
<i>buf</i>	Length of buffer to be written.

Definition at line 238 of file file_writer.cc.

```

    {
        boost::mutex::scoped_lock lock(_write_bufs_mutex);
        _write_bufs.push_back(b);
        return true;
    }

```

9.366.3.6 void FileWriter::write_block () [protected]

Writes a block to disk using the specified file descriptor.

Parameters

<i>fd</i>	The file descriptor to which the data will be sent.
-----------	---

Definition at line 244 of file file_writer.cc.

```

    {

9.671.1 Detailed Description

struct [mdio_if_info](#) - Ethernet controller MDIO interface : PRTAD of the PHY (MDIO_ - PRTAD_NONE if not present/unknown) : Mask of MMDs expected to be present in the PHY. This must be non-zero unless = MDIO_PRTAD_NONE. : MDIO modes supported. If MDIO_SUPPORTS_C22 is set then MII register access will be passed through with = MDIO_DEVAD_NONE. If MDIO_EMULATE_C22 is set then access to commonly used clause 22 registers will be translated into clause 45 registers. : Net device structure : Register read function; returns value or negative error code : Register write function; returns 0 or negative error code

- [StatsWriter](#) *const [_sw](#)
- [PFR](#) * [_ring](#)
- boost::uint8_t * [_net_buf](#)
- enum NetReader:: { ... } [_state](#)

9.724.1 Detailed Description

Manages high speed capture of data from network interface using PF_RING. Data are read in from an assigned interface using the PF_RING API. The data are read in to specially allocated and sized buffers, that have been optimized for disk throughput. Once a buffer is full, it is passed on to a [FileWriter](#) to be written to disk.

Definition at line 49 of file `net_reader.h`.

9.724.2 Member Enumeration Documentation

9.724.2.1 anonymous enum [protected]

State variable. This variable is changed in response to `cmd_X()` commands applied to this object. The variable is used in the [run\(\)](#) method to determine what state the object is currently in, so that the appropriate `handle_X()` method can be called.

Definition at line 154 of file `net_reader.h`.

```
{ IDLE, READ_FROM_NETWORK, STOP } _state;
```

9.724.3 Constructor & Destructor Documentation

9.724.3.1 NetReader::NetReader (const int *id*, const std::string *interface*, const int *snaplen*, const int *payload_length*, const int *buffer_size*, const bool *promiscuous*, FileWriter *const *fw*, StatsWriter *const *sw*, const double *command_interval*)

Constructor.

Parameters

<i>id</i>	A unique identifies for this object. Used in logging.
<i>interface</i>	The name of the network interface from which data will be captured.
<i>snaplen</i>	The total amount of data to be captured (data packet headers from layer2 and up are included in the count).
<i>payload_length</i>	The total length of the UDP payload. This is the amount of data that needs to be extracted from each packet and then stored to disk.
<i>buffer_size</i>	The size of the optimal buffers that are used to transfer data from network interface to disk. Typically, these are a multiple of the system page size, and aligned to page size boundaries (e.g, page size of 256B, buffer size of 1048576B).
<i>promiscuous</i>	Whether or not to put the network interface into promiscuous mode.
<i>fw</i>	A pointer to a FileWriter object.
<i>sw</i>	A pointer to a StatsWriter object.
<i>command_interval</i>	The main executin thread in run() will attempt to check for new commands every <i>command_interval</i> seconds. The actual interval between checks may be larger than this if the execution thread spends longer than <i>command_interval</i> processing individual tasks.

9.724.5 Member Data Documentation

9.724.5.1 `const int NetReader::_buffer_size` `[protected]`

The size of the buffer being filled. These buffers are optimized for disk throughput and have custom memory allocation and alignment mechanisms. Typically, these buffers are orders of magnitude larger than a packet (e.g. 1 MB v. 9KB).

Definition at line 127 of file net_reader.h.

9.724.5.2 `FileWriter* const NetReader::_fw` `[protected]`

A pointer to the [FileWriter](#) object that will write the data to disk. Once a buffer is filled, it is passed in to the [FileWriter](#) object where it is queued awaiting transfer to disk.

Definition at line 135 of file net_reader.h.

9.724.5.3 `const std::string NetReader::_interface` `[protected]`

The name of the network interface from which to capture data (e.g., eth2).

Definition at line 114 of file net_reader.h.

9.724.5.4 `boost::uint8_t* NetReader::_net_buf` `[protected]`

A pointer to the temporary buffer used to store data recently captured from the network interface.

Definition at line 148 of file net_reader.h.

9.724.5.5 `const int NetReader::_payload_length` `[protected]`

The length of the payload (i.e. the amount of data to extract and write to disk).

Definition at line 121 of file net_reader.h.

9.724.5.6 `PFR* NetReader::_ring` `[protected]`

A pointer to the PF_RING data structure that tracks the PF_RING state and data structures.

Definition at line 144 of file net_reader.h.

9.724.5.7 StatsWriter* const NetReader::_sw [protected]

A pointer to a [StatsWriter](#) object that will keep track of throughput statistics for this object. The [StatsWriter](#) will also write these statistics to CSV file on disk.

Definition at line 140 of file net_reader.h.

9.972 StatsWriter Class Reference

```
#include <stats_writer.h>
```

Inheritance diagram for StatsWriter:

Public Member Functions

- **StatsWriter** (const int id, const std::string &stats_file, const int stats_interval, const double command_interval)
- virtual **~StatsWriter** ()
Destructor.
- virtual void **start** ()
Start the main processing loop [run\(\)](#) in its own thread of execution.
- virtual void **join** ()
Wait for the main processing loop/thread to exit.
- virtual void **cmd_stop** ()
- void **cmd_write_to_disk** ()
- void **update** (const boost::uint64_t &packets, const boost::uint64_t &bytes, const boost::uint64_t &dropped_packets, const boost::uint64_t &buffer_size)

Protected Types

- enum { **IDLE**, **WRITE_TO_DISK**, **STOP** }
The state of the object.

Protected Member Functions

- virtual void **run** ()
Main processing loop.
- virtual void **handle_stop** ()
- virtual void **handle_idle** ()
Command handler. Handles the IDLE state.
- virtual void **handle_write_to_disk** ()

Protected Attributes

- const int **_stats_interval**
The interval between internal statistics updates and dumps to disk.
- boost::uint64_t **_num_packets**
The total number of packets that have been processed so far.
- boost::uint64_t **_num_bytes**
The total number of bytes that have been processed so far.

- `boost::uint64_t _dropped_packets`
The number of dropped packets.
- `boost::uint64_t _buffer_size`
The size of the file buffer.
- `std::ofstream _stats_stream`
Nicely formatted statistics output (useful for real-time stats output).
- `std::ofstream _csv_stream`
CSV formatted statistics dump for postprocessing.
- `enum StatsWriter:: { ... } _state`
- `boost::mutex _mutex`
Mutex for serializing multi-threaded access to shared resources.
- `struct timeval _start_time`
The time logging was started.
- `struct timeval _last_time`
The most recent statistics update time.
- `double _average_packet_rate`
The exponentially weighted moving average packet rate.
- `double _average_byte_rate`
The exponentially weighted moving average byte rate.
- `boost::uint64_t _last_num_packets`
- `boost::uint64_t _last_num_bytes`
- `long _interval`
- `const double _ALPHA`
The parameter used in the exponentially weighted moving average.
- `const double _BPS_TO_MBPS`
A constant that converts from BPS to MBPS.
- `const int _PAGE_LENGTH`

9.972.1 Detailed Description

Todo

Track this down and fix.

This class maintains counters, averages, etc. for tracking the statistics of a monitored object. The monitored object periodically calls the `update()` method which then updates the statistics counters etc. and then updates instantaneous, exponentially averaged, and long term statistics. Periodically, the data are written out to a CSV file with a name that is unique to the monitored object.

Definition at line 50 of file `stats_writer.h`.

9.972.2 Constructor & Destructor Documentation

9.972.2.1 StatsWriter::StatsWriter (const int *id*, const std::string & *stats_file*, const int *stats_interval*, const double *command_interval*)

Constructor.

Parameters

<i>id</i>	A unique id for this object. Used for logging.
<i>stats_file</i>	The name of the statistics CSV file.
<i>command_interval</i>	The main executin thread in run() will attempt to check for new commands every <i>command_interval</i> seconds. The actual interval between checks may be larger than this if the execution thread spends longer than <i>command_interval</i> processing individual tasks.

9.972.3 Member Function Documentation

9.972.3.1 void StatsWriter::cmd_stop() [virtual]

External API command. Insert a STOP command into the object's command queue for processing.

Implements [Threaded](#).

Definition at line 133 of file stats_writer.cc.

```
        {
    LOG4CXX_INFO(logger, "Received STOP");
    _state = STOP;
}
```

9.972.3.2 void StatsWriter::cmd_write_to_disk ()

External API command. Insert a WRITE_TO_DISK command into the object's command queue for processing.

Definition at line 138 of file stats_writer.cc.

```
        {
    LOG4CXX_INFO(logger, "Received WRITE_TO_DISK");
    _state = WRITE_TO_DISK;
}
```

9.972.3.3 void StatsWriter::handle_stop () [protected, virtual]

Command handler. Handles the STOP command/state. On receiving this command, the [FileWriter](#) object will stop processing and exit the [run\(\)](#) method at the next opportunity.

Implements [Threaded](#).

Definition at line 143 of file stats_writer.cc.

```

}
```

9.972.3.4 void StatsWriter::handle_write_to_disk () [protected, virtual]

Command handler. Handles the WRITE_TO_DISK command/state. On receiving this command, the [StatsWriter](#) object will start tracking statistics, and periodically updating them, and writing them to disk.

Definition at line 151 of file stats_writer.cc.

9.1017 Threaded Class Reference

```
#include <threaded.h>
```

Inheritance diagram for Threaded:

Public Member Functions

- [Threaded](#) (const int id, const int command_interval)
- virtual [~Threaded](#) ()
Destructor.
- virtual void [start](#) ()=0
Start the main processing loop [run\(\)](#) in its own thread of execution.
- virtual void [join](#) ()=0
Wait for the main processing loop/thread to exit.
- virtual void [cmd_stop](#) ()=0

Protected Member Functions

- virtual void [run](#) ()=0
Main processing loop.
- virtual void [handle_stop](#) ()=0
- virtual void [handle_idle](#) ()=0
Command handler. Handles the IDLE state.

Protected Attributes

- const int [_id](#)
A unique identifier for this object.
- const int [_command_interval](#)
The command interval.
- bool [_running](#)
- boost::thread [_thread](#)
The thread data structure.

9.1017.1 Detailed Description

This is the Abstract Base Class for all classes that require a separate thread for executing their main processing loop.

Definition at line 38 of file threaded.h.

9.1017.2 Constructor & Destructor Documentation

9.1017.2.1 [Threaded::Threaded](#) (const int *id*, const int *command_interval*) [inline]

Constructor.

Parameters

<i>id</i>	A unique id for this object. Used for logging.
<i>command_interval</i>	The main executin thread in run() will attempt to check for new commands every <i>command_interval</i> seconds. The actual interval between checks may be larger than this if the execution thread spends longer than <i>command_interval</i> processing individual tasks.

Definition at line 52 of file `threaded.h`.

```

        :
        _id(id),
        _command_interval(command_interval),
        _running(false),
        _thread() {}

```

9.1017.3 Member Function Documentation

9.1017.3.1 virtual void Threaded::cmd_stop() [pure virtual]

External API command. Insert a STOP command into the object's command queue for processing.

Implemented in [FileWriter](#), [NetReader](#), and [StatsWriter](#).

9.1017.3.2 virtual void Threaded::handle_stop() [protected, pure virtual]

Command handler. Handles the STOP command/state. On receiving this command, the [FileWriter](#) object will stop processing and exit the [run\(\)](#) method at the next opportunity.

Implemented in [FileWriter](#), [NetReader](#), and [StatsWriter](#).

9.1017.4 Member Data Documentation

9.1017.4.1 bool Threaded::_running [protected]

A flag used in the `while()` conditional at the top of the [run\(\)](#) method. The main thread of execution only continues to execute while `_running` is true.

Definition at line 87 of file `threaded.h`.

The documentation for this class was generated from the following file:

- `src/net2disk/threaded.h`

9.1020 Timer Class Reference

Very useful class for timing intervals.

```
#include <mark6.h>
```

Public Member Functions

- `Timer ()`
- `void restart ()`
Restart the timer by resetting start time.
- `double elapsed ()`

9.1020.1 Detailed Description

Very useful class for timing intervals.

Definition at line 69 of file mark6.h.

9.1020.2 Constructor & Destructor Documentation

9.1020.2.1 Timer::Timer () [inline]

Constructor. Start is set so interval measurement begins as soon as the [Timer](#) object is constructed.

Definition at line 83 of file mark6.h.

```
{
    timerclear(&_start);
    timerclear(&_stop);
    timerclear(&_duration);
    gettimeofday(&_start, NULL);
}
```

9.1020.3 Member Function Documentation

9.1020.3.1 double Timer::elapsed () [inline]

Calculate and return the total amount of time that has elapsed since _start was last initialized.

Returns

Amount of time (in seconds) since _start was initialized.

Definition at line 98 of file mark6.h.

```
{
    gettimeofday(&_stop, NULL);
    timersub(&_stop, &_start, &_duration);
    return static_cast<double>(_duration.tv_sec)
        + static_cast<double>(_duration.tv_usec)/1000000.0;

10.1.1 Detailed Description

This file define a standard header used as a first entry point to exchange information between firmware/driver and driver.

The header structure can be anywhere in the mcp. It will usually be in the .data section, because some fields needs to be initialized at compile time.

The 32bit word at offset MX_HEADER_PTR_OFFSET in the mcp must contains the location of the header.

Typically a MCP will start with the following:

```
.text
.space 52      ! to help catch MEMORY_INT errors
bt start      ! jump to real code
nop
.long _gen_mcp_header
```

The source will have a definition like:

```
mcp_gen_header_t gen_mcp_header = {
    .header_length = sizeof(mcp_gen_header_t),
    .mcp_type = MCP_TYPE_XXX,
    .version = "something $Id: mcp_gen_header.h,v 1.9 2009-02-27 16:29:36 loic
Exp $",
    .mcp_globals = (unsigned)&Globals
};
```

In most case using the convenience MCP_GEN_HEADER_DECL() macro is simpler than doing a full manual declaration.

Definition in file [mcp_gen_header.h](#).
